

# On the State of Serverless Computing

Edward Oakes

OpenLambda

**WISCONSIN**  
UNIVERSITY OF WISCONSIN-MADISON

# Outline

## Academic Perspective

- New Problems
- Evaluation

## Developer Perspective

## Academic & Developer Cooperation

# Academic Perspective

- New challenges in scheduling
  - Global load balancing & fair resource allocation
- Increased importance of data locality & management
  - Lambdas are stateless, but not all applications can be
- Security concerns
- Pushing the limits of containers
  - Something else?

Cloud provider has more **control** & **information** than ever before

# The Evaluation Challenge

- How can we evaluate at scale?
- What metrics should we evaluating?
- What do large applications built on serverless look like?
  - What types of applications are important?

To understand what's important in serverless,  
we need to build a **community**

# Developers' Perspective

- Only pay for resources they actually use
- Remove the overhead of configuring a server, network, etc.
- Simplify deployment
- Execute in response to events

Performance shouldn't be our only focus

# Looking Forward

Reconcile the goals of researchers & developers

## **performance+**

- Package support (Pipsqueak)
- Fine-grained accounting
- Detailed logging & traces
- ...

Thank you!
