The future of serverless*

- "Call graph → component graph" increases
- Standardized monitoring?
  - Everyone except Tier I providers
- Potential for vendor-specific marketplaces
- Academia: research on methods for independent services to cooperate to reduce latency induced by abstraction
- Long term: increased segmentation in businesses and careers
  - Technology building will happen mostly in B2B providers
    - A given B2B service provider may *themselves* be serverless
  - End-user companies will require fewer traditional back-end dev and ops jobs; more front-end devs, and back-end dev/ops experienced in service integration and monitoring

*according to Ben Kehoe
